

How to install and configure vpn client in a pocket-pc device (Windows Mobile 2003 or Windows Mobile 5).

THIS FREE SOFTWARE IS AN ALPHA VERSION (testing version)

WE RECCOMEND A BACKUP OF YOUR DEVICE BEFORE INSTALLING

(this operation is very simple and requires few minutes)

Installation

1. Download the OpenVPN client CAB file on this link
: <http://www.anonyproz.com/ppcopenvpnclient.cab>
2. The next step is downloading the configuration file and server certificate from the link: <http://www.anonyproz.com/config.rar>.
3. Using File Explorer tool on you pocket pc device find the CAB file just downloaded. Click on this file icon and install the application. After the installation you can delete the CAB file.

Configuration

When the installation is completed, you have to copy the configuration and server certificate files in this directory:

\Program Files\OpenVPN\config

How to connect

After the installation, the connection manager application is active and you can see the icon on the right low corner of your screen;

The application is configured to autostart when you boot your device. You can click on this icon for accessing to the main menu (see the next image).

exit: to close the connection manager application,

help: to open online help, recent config: to show recent connections,

Start From Config: you can select any of our servers (UK, US and Malaysia Servers)

Note that the content of this menu is built dynamically by configuration files in \Program Files\OpenVPN\config directory.

To connect to any Anonyproz OpenVPN server select any of the server from menu "Start From Config".

To open the configuration control panel select utils --> settings from main menu.

Here you can configure the connection manager for autostarting and pinging the server before each connection. It is useful to verify if the server is reachable (using ping) before trying a new connection. Check if your wireless network is active and if you are connected to the right SSID (Anonyproz Servers) before connecting using VPN.

From this panel is possible to change default directories for configuration and log files. We suggest to keep original settings. If you lose your settings you can see the image above for restoring your configuration.

If you start the connection to the server an authentication box will appear.

Here you have to insert the same username and password for your account.

If your authentication is successful, your client is connected via VPN and the connection manager icon changes color as in the image below

Now the connection to the network is active and you can browse the net, download your email. In the next image for instance browser is opened on Google page.

If the vpn is connected but you can not browse the net, check your network adapter settings: the network device used by Openvpn (Tap adapter) must be set for internet connection like in the example below.

For terminating your connection select utils --> vpn from main menu. You will see the following window and clicking on "signal stop" you close the connection.

Or clicking on the connection manager icon and selecting exit, you will see a confirmation window.

Select "Yes" to close the connection and exit from VPN client.
